

Gansy, the revolutionary IPC Gansow scrubber drier

A walk behind scrubber driers with a 45 cm scrubbing width, **Gansy** represents the essence of the IPC Gansow philosophy - productivity, profitability, high quality results, low costs, ergonomics, ease of use and respect for the environment.

The structural revolution of **Gansy** is originated from the different idea of tank that, instead of a closed bin put inside the machine, in Gansy is a bucket which can be filled, emptied and rinsed. **Gansy** has two buckets in full view, one on the top of the other. They are positioned on a trolley which also holds the washing assembly; the two buckets are the detergent and dirty water tanks, that originated the "**Reusable System**" concept – the recycling of the dirty water collected in the top tank that passes to the detergent tank below through a filter that removes the coarsest dirt. This reduces water consumption because the water flow is rationalised in a smart and responsible way and at the same time increases productivity because the same quantity of liquid can be used to clean a larger surface.

Both tanks are extremely easy to remove, transport and clean and the detergent tank can also be drained through the discharge hose without being removed.

Small and compact, **Gansy** can be easily dismantled and remounted, and can be transported in a small box, reducing to a minimum packaging and therefore waste production, in full respect of the environment.

Gansy represents the synthesis of the exclusive **IPC Gansow** systems - from the "**Centre Flow System**" that optimises water and detergent consumption to the "**Constant Self Adapting Brush System**" that assures constant brush pressure on the floor, from the "**Brush Pressure Boost System**" which enables brush pressure to be intensified or lightened simply by moving the handlebar up or down to the "**V Shape**" squeegee which dries the floor perfectly in a single time.

Gansy is available in cable or battery (12V-140 Ah) versions with a working time of about an hour, equal to four full water tanks. It can also be equipped with an on-board battery charger.

Particularly tough with chassis in fully coated steel and with polypropylene cowling and buckets, **Gansy** is easy to maintain because all its main components can be removed without tools and all the motor components are easily accessible, thanks to the front cowling that can be completely opened.

But **Gansy** has other aces in the hole compared to the same range products on the market - dynamism and modularity.

The body and tanks are installed on a trolley frame, making the machine manoeuvrable and easy to transport. Moreover, **Gansy** can also be turned into an out-and-out cleaning workshop thanks to **IPC Ready System** professional equipments, such as the rear waste bin, the tissue roller holder and other accessories which can be fitted on the front of the machine.

Small and dynamic, **Gansy** turns the concept of movement into art.
